

- **Entrenched or Incised meander**—forms when a river maintains its meandering course, but vertical erosion leads to meander between steep valleys

- **Ingrown meander**—refers to meanders that cut sideways into the banks so that there is a slight overhang above the stream.

### River capture

- River capture occurs when one river alters the watershed through headward erosion and steal the waters of the other river compelling the other river to change its direction of flow.
- there are the two main concepts associated with river capture: the concept of abstraction and the process of river capture

### **Features of River capture**

- **Captor stream**, also known as the pirate stream—this is the more energetic stream that eroded through the watershed and captured another stream
- **Captive stream**—this is the less energetic stream that was captured by the captor stream

Do not get confused, the river that erodes backwards to steal the other river's water is called the **captor stream**. Therefore, the one whose water was stolen is called the **captive stream**.

- **Misfit stream**, also known as the **beheaded stream**—refers to that stream which has lost its headwaters, and now having not enough volume of water to fill the original river valley.
