1. Describe what is going on in the simulation between the two plates

- a. What type of boundary is this?

This is a convergent plate boundary.

2. What is being produced by the movement of the plates?

a.

When the plates began to move, it caused the land to begin to shift. After twenty million years, there was a mountain range that began to form.

3. Could this be what produced some of the mountains in Arkansas? If so, which range? Which plates were involved?

I believe that this is what created the range in Arkansas. The range is called Ouachita and Ozark. What I have found when researching is that the North American and South American plates were the reason that the Range was created.

Tectonics Eldridge M. Moores, Robert J. Twiss, 2014-07-23. Deformation of the Earth's crust happens at a multitude of scales ranging from submicroscopic to planetary. Tectonics explores structures and processes from regional to global, differentiating itself from the material covered in most structural geology textbooks. Moores and Twiss emphasize basic principles and methodologies of tectonics, embracing the time-honored perspective of using present processes to understand the past. Comprehensive in scope and detail, coverage includes the effects of plate motions and reconstructions and the resultant structures associated with active rift transform and subduction boundaries, as well as triple junctions and collision zones, deformations of both the ocean basins and the continents and orogenic belts. Moores and Twiss present tectonics as an open-ended field of study in which assumptions can be challenged and interpretations changed. The authors emphasize the use of models as a means of understanding observations and putting them in context to maintain a distinction between what we know from observing the Earth and what we infer from interpretation.

Plate Tectonics Naomi Oreskes, 2018-10-08. This book provides an overview of the history of plate tectonics, including in context definitions of the key terms. Soft Plate and Impact Tectonics Antonio Ribeiro, 2012-12-06. Structural geology is a core component of knowledge needed for intelligent living with our planet, truly sustainable development. It gives me great pleasure to write this brief foreword for the work by Antonio of Lisboa. When we consider the foundations of our life support systems, climate, the biosphere, soil, materials, energy, waste management, and today in the world of cities, structural stability, we require exact knowledge of the structure of our planet and change in these structures. Homo sapiens has lived on our planet for a very short period. Our planet is cooling by conduction and convection, and it is the structures that result from these processes that control the global climate, our resource base, and even soil quality and food security, etc. etc. As the title of this book suggests, some processes are slow and some fast. I was born on a farm in Southern New Zealand, quite close to the magnificent and profound influence of the Southern Alps. I often think that watching that environment on my mental development.
