Aquatic Humic Substances Ecology And Biogeochemistry Ecological Studies:

Aquatic Humic Substances Dag O. Hessen,1998-07-16 Humic substances occur in all kinds of aquatic systems but are particularly important in northern coniferous areas They strongly modify the aquatic ecosystems and also constitute a major problem in the drinking water supply This volume covers all aspects of aquatic humic substances from their origin and chemical properties their effects on light and nutrient regimes and biogeochemical cycling to their role regarding organisms productivity and food web organization from bacteria to fish Special emphasis is paid to carbon cycling and food web organization in humic lakes but aspects of marine carbon cycling related to humus are treated as well **Aquatic Humic**

Marine Chemistry P.J. Wangersky,2000-03-27 The carbon dioxide absorption and gas exchange at the sea surface marine aerosols and their photochemistry the oceanic carbon cycle as well as biomarkers in marine ecosystems and related topics are of primary importance for understanding our global ecosystem The topics addressed in this volume are all stemming from areas which have developed only in the last ten years of research or which have gone into decidedly new directions in that time In most cases the recent research has been driven by advances in instrumentation or by large scale international cooperations Thus this volume is also aiming at interdisciplinary and international cooperations in the future **The Lakes**

Handbook Patrick O'Sullivan,C. S. Reynolds,2008-04-15 Continuing concern about water supply and quality ecosystem sustainability and restoration demands that the modern approach to the management of lakes and reservoirs should be based on a sound understanding of the application of the scientific and ecological principles that underlie freshwater processes The Lakes Handbook provides an up to date overview of the application of ecologically sound approaches methods and tools using experience gained around the world for an understanding of lakes and their management Volume one of the Handbook

addresses the physical and biological aspects of lakes pertinent to lake management emphasising those aspects particularly relevant to large still bodies of water Volume two then considers lake management with particular emphasis on sustainability restoration and rehabilitation This handbook will be invaluable to ecologists environmental scientists physical geographers and hydrologists involved in limnological research as well as advanced undergraduate and graduate students looking for authoritative reviews of the key areas of limnological study Brings together basic science and management issues International coverage and international authors Reviews management issues at a level suitable for the non expert

Ecology of Humic Substances in Freshwaters Christian Steinberg, 2013-11-11 Humic Substances color all waters more or less brown Their concentrations exceed all carbon of living organisms by at least one order of magnitude Opposite to former paradigms they participate in almost any metabolic pathway They protect against UV irradiation enable indirect photolysis and thus purify hazardous chemicals they provide inorganic and organic nutrients may form cryptic genes with DNA and dampen metabolic fluctuations More recently they can increase adverse effects of hazardous chemicals and they can directly interfere with organisms The book tries to relate effects to structural features

Biodiversity in Europe Laszlo Nagy, Georg Grabherr, Christian Körner, Desmond B.A. Thompson, 2003-06-12 The United
 Nations Conference on the Environment and Development UNCED held in Rio de Janeiro in 1992 spawned a multitude of pro
 grammes aimed at assessing managing and conserving the earth s biological diversity One important issue addressed at the
 conference was the mountain environment A specific feature of high mountains is the so called alpine zone i e the treeless
 regions at the uppermost reaches Though covering only a very small proportion of the land surface the alpine zone contains a
 rela tively large number of plants animals fungi and microbes which are specifi cally adapted to cold environments This zone
 contributes fundamentally to the planet s biodiversity and provides many resources for mountain dwelling as well as lowland
 people However rapid and largely man made changes are affecting mountain ecosystems such as soil erosion losses of
 habitat and genetic diversity and climate change all of which have to be addressed As stated in the European Community
 Biodiversity Strategy the global scale of biodiversity reduction or losses and the interdependence of different species and
 ecosystems across national borders demands concerted international action Managing biodiversity in a rational and
 sustainable way needs basic knowledge on its qualitative and quantitative aspects at local regional and global scales This is
 particularly true for mountains which are distributed throughout the world and are indeed hot spots of biodiversity in
 absolute terms as well as relative to the surrounding lowlands
