phenomenon that helps rural livelihoods and propels economic development. Contrary to staple crops, industrial crops are cultivated with the intention of being sold for a high profit. Industrial crops are a crucial component of plans to increase food security because they offer the required stability during periods of economic or climatic crises. In order to maintain their livelihood and food security, many farm households balance the advantages and disadvantages of producing food crops and industrial crops. Avoiding land use rivalry with crops grown for food and feed production is crucial when considering growing industrial crops on agricultural soils. The past several years have seen a rise in the awareness of scholars and decision makers regarding the immediate and long term effects of climatic variables on economic food security, social and political results. In order to sustain food production with more climate resilient crops for future generations, genetic variety, both natural and artificial, is crucial. Therefore, addressing the problem of finding a compromise between increasing crop production under a specific set of conditions and reducing the chance of crop failure when conditions change is important and difficult. An assortment of meteorological conditions is used to grow industrial crops. Many are subsistence farmers who run extremely tiny farms with very little agricultural input to produce products that can be sold. It is a significant problem to preserve the variety of these crops and handle all crop culture related difficulties. By offering the knowledge required to minimize the dangers of industrial crop breeding through managing genetic diversity, the author believes that this book will primarily address a need that has not yet been met in this and other grower groups.

Improvement of Oil-Seed and Industrial Crops by Induced Mutations - Proceedings of an Advisory Group Meeting, Vienna, 17-21 November 1980  
Organized by the Joint Fao International Atomic Energy Agency, 1982      Induced Mutation Breeding Subodh Kumar Datta, 2023-05-24

The book is an excellent reference collection of the research conducted by different workers on induced mutagenesis worldwide for more than 80 years. One can get almost all mutation breeding references at one place. The book gives a coherent and concise account of all the important and relevant aspects related to induced mutagenesis with an emphasis on recent developments in the field of crop improvement. The references have been arranged crop wise and important topic wise which deal with not only classical mutation breeding but also spontaneous mutations, somaclonal variations, nanoparticles and relevant modern aspects. The book highlights 22 chapters covering holistic information on almost all important components such as radiosensitivity, chromosomal and morphological abnormalities, detection of mutation, management of chimera, present status of mutation etc. of Mutation Breeding. Chapters are very informative and one can follow the references on crop and aspect basis since the start of mutation breeding work. This book is an excellent resource for researchers and students for understanding proper applications of induced mutations in crop improvement and biological research. It is of interest and useful to graduate and postgraduate students, horticulturists, floriculturists, agricultural scientists and breeders related to crop improvement program.

Somaclonal Variation and Induced Mutations in Crop Improvement S.M. Jain, D.S. Brar, B.S. Ahloowalia, 2013-03-14

Genetic variability is an important parameter for plant

breeders in any conventional crop improvement programme. Very often the desired variation is unavailable in the right combination or simply does not exist at all. However, plant breeders have successfully recombined the desired genes from cultivated crop germplasm and related wild species by sexual hybridization and have been able to develop new cultivars with desirable agronomic traits such as high yield, disease, pest and drought resistance. So far, conventional breeding methods have managed to feed the world's ever-growing population. Continued population growth, no further scope of expanding arable land, soil degradation, environmental pollution and global warming are causes of concern to plant biologists and planners. Plant breeders are under continuous pressure to improve and develop new cultivars for sustainable food production. However, it takes several years to develop a new cultivar. Therefore, they have to look for new technologies which could be combined with conventional methods to create more genetic variability and reduce the time in developing new cultivars with early maturity and improved yield. The first report on induced mutation of a gene by H.J. Muller in 1927 was a major milestone in enhancing variation and also indicated the potential applications of mutagenesis in plant improvement. Radiation sources such as X-rays, gamma rays and fast neutrons and chemical mutagens e.g. ethyl methane sulphonate have been widely used to induce mutations. Bibliography of Agriculture with Subject Index, 1993-10. *Genetic Improvement of Field Crops* C.B. Singh, Dharendra Khare, 2015-01-01. Opportunities exist for increasing food production in a sustainable manner through the genetic improvement of field crops. One of the potential tools for improvement of the crop performance is the genetic alteration and selection. **Improvement of Oil-seed and Industrial Crops by Induced Mutations**, 1982.

**Improvement of Grain Legume Production Using Induced Mutations** Joint FAO/IAEA Division of Isotope and Radiation Applications of Atomic Energy for Food and Agricultural Development, 1988. Applied Mutation Breeding for Vegetatively Propagated Crops C. Broertjes, A.M. van Harten, 2013-10-22. When the first edition of this book appeared in 1978 it was warmly received. Most readers and reviewers especially valued the extensive coverage of the literature in the chapters dealing with the different crops, a valuable and timely addition to plant breeders and of outstanding value to breeders of ornamental plants. The book's special strength resides in the extensive review of literature. *International Journal for Breeding Research*. This is also reflected by the many times that the work has been referred to in other publications. This new edition provides plant breeders as well as scientists with an up-to-date overview of methods and results of the application of mutation breeding in order to genetically improve vegetatively propagated crops. General principles and background information about mutation breeding in general, methods of treatment, material to be treated and results are discussed in the introductory chapters, followed by a description of the specific situation in each of the vegetatively propagated crops ever used in a mutation breeding project. This volume brings together all the important and relevant literature in the field. It provides a complete account of mutation breeding of vegetatively produced crops, presenting conclusions about the value of the method, its possibilities, limitations and shortcomings and the possible difficulties of further application in various crops.

The initial chapters deal with the interactions between mutagenic treatment and plant material such as aspects of mutagenic treatment post irradiation behaviour of shoot apices and adventitious bud techniques All available literature is then discussed crop by crop and critically evaluated Almost 1700 references are covered and whenever possible suggestions for more efficient application of mutation breeding methods are given
