Elucidating the function of mycorrhizal-induced Kunitz protease inhibitors and characterization of their putative target proteases in Medicago truncatula Hirsch, Stefanie S.,2014-03-11 Most terrestrial plants live in symbiosis with arbuscular mycorrhizal fungi In this study a mycorrhizal induced gene family of Medicago truncatula encoding putative Kunitz protease inhibitors was functionally characterized by means of biomolecular biochemical microscopical and in silico methods Their putative target proteases were identified among a clan of serine carboxypeptidases Results suggest that both protein families work functionally together to control mycorrhizal establishment

Vitamins and Hormones ,1988-12-01 Vitamins and Hormones **Cell-Cell Interactions in the Release of Inflammatory Mediators** Patrick Y-K Wong,Charles N. Serhan,2012-12-06 This volume constitutes in part the proceedings of the symposium on Cell Cell Interaction and Release of Inflammatory Mediators organized by Drs Patrick Y K Wong and Charles N Serhan and presented at the FASEB meeting in Washington D C in April 1990 It contains chapters by the symposium speakers as well as contributions from investigators in this field Readers will find exciting advances in this volume which contains chapters dedicated to state of the art knowledge in the field of Cell Cell Interaction and the functions of released mediators in inflammatory diseases This book includes cutting edge investigations on transcellular eicosanoid biosynthesis cytokines PAF and adhesion as well as interactions of inflammatory cells with endothelial cells and kidney A1 so the control and regulation of renal function by lipid mediators generated during cell cell interactions between renal mesangial cells and leukocytes has generated insight into the cell biology and regulatory role of these mediators in the kidney Moreover the relationship between these areas is discussed in sequelae of both asthmatic and renal diseases We hope that some of the enthusiasm and excitement present in this research are also evident here and that this volume will serve as a reference for researchers teachers and students to survey this rapidly growing field **Glycoprotein Methods and Protocols** Anthony P. Corfield,2007-10-26 The mucins mucus glycoproteins have long been a complex corner of glycoprotein biology While dramatic advances in the separation structural analysis biosynthesis and degradation have marked the progress in general glycoprotein understanding the mucins have lagged behind The reasons for this lack of progress have always been

clear and are only now being resolved The mucins are very large molecules they are difficult to separate from other molecules present in mucosal secretions or membranes they are often degraded owing to natural protective functions or to isolation methodology and their peptide and oligosaccharide structures are varied and complex Understanding these molecules has demanded progress in several major areas Isolation techniques that protect the intact mucins and allow dissociation from other adsorbed but discrete molecules needed to be developed and accepted by all researchers in the field Improved methods for the study of very large molecules with regard to their aggregation and polymerization were also needed Structural analysis of the peptide domains and the multitude of oligosaccharide chains was required for smaller sample sizes for multiple samples and in shorter time In view of these problems it is perhaps not surprising that the mucins have remained a dilemma of obvious biological importance and interest but very difficult to analyze Prostaglandins, Leukotrienes, Lipoxins, and PAF J. Ingram, Peter G. Isaac, 2012-12-06 Mark Chase There are many literature resources available to molecular biologists wishing to assess genetic variation but the myriad of techniques and approaches potentially available to the plant breeder and the evolutionary biologist is truly bewildering and most have never been evaluated side by side on the same sets of samples Additionally it is often not recognized that tools that are useful for breeders can often be adapted for use in evolutionary studies and vice versa but this is generally the case The borderline between population genetics and phylogenetics is vague and difficult to assess and a combination of both types of tools is best when it is not clear with which area one is dealing Furthermore it is not now appropriate to use just one type of marker in any kind of study most markers have the potential to misinform under certain conditions so it is always wise to incorporate at least two different types of assessments into any project This volume is designed to facilitate this sort of multiple approach and provides comparative data on most currently available methods so that researchers can more intelligently select those appropriate to their area of interest regardless of whether it is in the realm of breeding or evolutionary biology *Sensor Technology for Water Quality Monitoring* P. Frymier, 2004-01-01 Biological wastewater treatment plants can be adversely affected by influent toxicity The effects can range from poor clarifier biomass settling and elevated effluent BOD and ammonia levels to total plant kills These problems could be minimized or eliminated if an effective method existed for continuously monitoring biological wastewater treatment plant influent for toxicity to the treatment plant microorganisms Current influent screening methods have not been proven to be adequate for adaptation to continuous screening in the field The primary reasons include the batch wise nature of the assays and an inadequate correlation between the assays and plant performance The goal of the research team was to create new bioluminescent biosensors from different types of bacteria found in biological wastewater treatment plants for the development of a multi channel continuous monitoring system A system built from multiple biosensors would make it possible to differentiate between potential influent toxicity effects to different classes of bacteria such as nitrifying and heterotrophic bacteria The research team found it unexpectedly challenging to apply common microbiological transformation methods for laboratory strains to the wastewater treatment plant strains The research team generated six new bioluminescent bioreporters from bacteria that are typical constituents of activated sludge Of particular significance is a bioreporter developed using a *Hyphomicrobium* sp which is a slow growing bacterium known to be present in significant numbers in some activated sludge plants Of the six generated initial bioluminescence and toxicity screening indicated that one strain a *Pseudomonad* was a particularly promising candidate due to its ease of cultivation and high light production Further toxicity testing however determined that the response of the strain to 48 organic compounds and 8 metals commonly found in wastewater was similar to that of a previously created strain Shk1 also a *Pseudomonad* Further work is therefore needed in
