Robo's trek into the upper respiratory tract is facilitated via a deep inhalation by the host. The micro-robot enters through the (1) _____ that communicate with the (2) _____. The reception area, called the (3) _____, contains coarse hairs that trap airborne particles and prevent them from entering the respiratory tract.

As the robot treks into the "cavernous arena" its "thermosensors" are activated owing to the warm and humid conditions. From the lateral walls of the cavity, the "air-conditioning" system, consisting of superior, middle, and inferior (4) _____ project toward the nasal septum. As air bounces off these projections, it is warmed and humidified and induces turbulence, causing airborne particles to come in contact with the mucous covering the surfaces of these lobular structures. A bony (5) _____ separates the oral and nasal cavities. A fleshy (6) _____ extends behind the hard palate, marking the boundary line between the superior (7) _____ and the rest of the pharyngeal regions. As the micro-robot approaches the (8) _____, it goes into an uncontrollable skid to the bottom because of mucus secretions that coat the pharyngeal walls.

Because the host is not swallowing, the elongate, cartilaginous (9) _____ permits the passage of the robot into the (10) _____, a region that contains the (11) _____, which are involved with sound production called (12) _____. After passing through the "sound barrier" Robo treks into a large "flume-like" duct, the (13) _____, which contains C-shaped cartilaginous rings that prevent collapse of the air passageway.

As the robot treks through the "wind tunnel" finger-like cellular extensions, the (14) _____ cause a "countercurrent" that serves to move mucus toward the (15) _____. Leaving the "wind tunnel," the robot's program directs it into the right (16) _____, a decision made by Mission Control. The robot's descent is complicated by increased "trek resistance" as the passageways get narrower and at times are almost impossible because of constriction caused by (17) _____ tissue in the submucosal lining of the (18) _____. After a few minor delays the trek continues into a sac-like (19) _____, where the atmosphere is dry and gaseous exchange creates a "breeze" that flows into and out of the "see-through" spheres. Robo's chemoreceptors "pick up" the presence of (20) _____ and (21) _____ passing freely between the air inside the spheres and the blood in the (22) _____.

Robo's return trek for exit is facilitated by a "reverse program" that includes a "ride" on the (23) _____, making the robot's ascent fast, smooth, and easy. Upon reaching the nasal cavity, removal of the little robot is immediate due to the host's need to blow his nose.
