The electromagnetic spectrum is made up of the different wavelengths of electromagnetic energy. The sun is the major source of _____ energy in our solar system. The nuclear reactions taking place in the sun give off incredible amounts of energy which includes radiation of many different wavelengths and each type of radiation has unique properties.

Gamma ray radiation is very dangerous because it carries very high levels of energy. Luckily for us the layers of the atmosphere block most of this type of radiation. The main sources of gamma ray radiation on earth are man-made nuclear weapons and nuclear plant meltdowns or gamma radiation that is used by doctors to treat some cancers.

_____, _____ radiation is the next shortest wavelength in the EM spectrum. This type of radiation has a lot of energy too and can be dangerous if humans are exposed to a lot of x-rays in their life. This radiation type is very helpful to medicine because it allows us to treat broken bones and to see cavities in teeth.

Next on the spectrum comes _____ radiation. This type of radiation has a wavelength that is still pretty short. It is another type of dangerous radiation, it can cause sunburn and skin cancer. Our ozone layer blocks out some but not all of the ultraviolet radiation coming from the sun. This type of radiation is invisible to us, but many insects including bees can see it.

Visible light is the type of electromagnetic radiation that we are the most familiar with. This type of radiation is the one we can detect with our sense of sight. The rainbow colors that make up the visible light wavelengths are:

- _____
- _____
- _____
- _____
- _____
- _____
- _____

The color of visible radiation with the shortest wavelength is violet (purple). Red has the longest wavelength of all the colors and so it is considered to be the color with the least energy.

Andrey R. Nikolaev, Sebastian Pannasch, Junji Ito, Artem Belopolsky, 2014-09-23 The recording and analysis of electrical brain activity associated with eye movements has a history of several decades While the early attempts were primarily focused on uncovering the brain mechanisms of eye movements more recent approaches use eye movements as markers of the ongoing brain activity to investigate perceptual and cognitive processes This recent approach of segmenting brain activity based on eye movement behavior has several important advantages First the eye movement system is closely related to cognitive functions such as perception attention and memory This is not surprising since eye movements provide the easiest and the most accurate way to extract information from our visual environment and the eye movement system largely determines what information is selected for further processing The eye movement based segmentation offers a great way to study brain activity in relation to these processes Second on the methodological level eye movements constitute a natural marker to segment the ongoing brain activity This overcomes the problem of introducing artificial markers such as ones for stimulus presentation or response execution that are typical for a lab based research This opens possibilities to study brain activity during self paced perceptual and cognitive behavior under naturalistic conditions such as free exploration of scenes Third by relating eye movement behavior to the ongoing brain activity it is possible to see how perceptual and cognitive processes unfold in time being able to predict how brain activity eventually leads to behavior This research topic illustrates advantages of the combined recording and analysis of eye movements and neural signals such as EEG local field potentials and fMRI for investigation of the brain processes in humans and animals The contributions include research papers methodology papers and reviews demonstrating conceptual and methodological achievements in this rapidly developing field Third Barnhart Dictionary of New English Robert K.
