*The first generation of transmissions were modified for potential enhancements in an effort to increase fuel economy and improved shift quality.

Changes were made with architectural hardware controls in conjunction with system software to increase capacity, reduce system delays (optimize system response times), and increase efficiency.

One example of an architectural change is with the 4-5-6 clutch. The wave plate was removed and an additional friction was added for increased torque capacity (Figures 3 and 4).

Figure 3

Figure 4

With the exception of the Low and Reverse Clutch, each clutch inside this transmission is operated by a solenoid through its respective regulating valve. With Gen 1 based models, a relatively small feed orifice was located on the line pressure supply side of the 4-5-6 Clutch Regulating Valve (Figure 5). With this orifice on one side of the valve and the wave plate on the opposite side of the valve, it stabilized the valve from having a pressure spike when it moved from a full feed position to regulation. When the cushion (wave) plate was removed to add an additional friction plate for increased torque capacity, this orifice was moved to the clutch pressure supply side of the valve (Figure 6). This was done to have a greater control of the apply of the clutch to prevent a harsh engagement with the absence of a cushion plate.
