Book And Brain Grounded Theory Temporal Spatial Design:

Brain-Grounded Theory of Temporal and Spatial Design Yoichi Ando, 2016-03-03 In this book brain grounded theory of temporal and spatial design in architecture and the environment is discussed. The author believes that it is a key to solving such global problems as environmental disorders and severe climate change as well as conflicts that are caused by the ill conceived notion of time is money. There are three phases or aspects of a person's life: the physical life, the spiritual or mental life, and the third stage of life when a person moves from middle age into old age and can choose what he or she wishes to do instead of simply what must be done. This book describes the temporal design of the environment based on the theory of subjective preference which could make it possible for an individual to realize a healthy life in all three phases. In his previously published work the present author wrote that the theory of subjective preference has been established for the sound and visual fields based on neural evidence and that subjective preference is an overall response of cooperating temporal and spatial factors associated with the brain's left and right hemispheres respectively. In this book based on that theory some examples are shown for the temporal design of architecture and the environment which may play important roles in the development of personality thus inducing creativity. Also discussed is how all individuals may find their own personality and develop it according to the preferred direction of their individual lives.

Signal Processing in Auditory Neuroscience Yoichi Ando, 2018-05-22 Signal Processing in Auditory Neuroscience Temporal and Spatial Features of Sound and Speech discusses how the physical attributes of different sounds manifest in neural signals and how to tease apart their different influences. It includes EEG/MEG as additional variables to be considered when studying neural mechanisms of auditory processing in general specifically in speech. Focuses on signal processing in human auditory neuroscience. Contains information that will be useful to researchers using a MEG/EEG recording of brain activity to study neural mechanisms of auditory processing and speech. Gives an important overview and methodological background for techniques that are useful in human auditory neuroscience.

Embodied and grounded cognition Anna Borghi, Diane Pecher, 2012-01-01 In the last 10-15 years the embodied and grounded cognition approach has become widespread in all fields related to cognitive science such as cognitive and social psychology, neuroscience, philosophy, anthropology, computational modelling, and robotics. According to this approach, our cognitive activity is grounded in sensory motor processes and situated in specific contexts and situations. Therefore, in this view, concepts consist of the reactivation of the same neural pattern that is present when we perceive and/or interact with the objects they refer to. In the same way, understanding language would imply forming a mental simulation of what is linguistically described. This simulation would entail the recruitment of the same neurons that are activated when actually acting or perceiving the situation, action, emotion, object, or entity described by language. In the last years, a lot of evidence has been collected in favour of EC and GC view. The aim of this Research Topic is twofold. First, it intends to give an idea of the field of embodied and grounded cognition in its broadness. We therefore intend to invite

scientists of different disciplines anthropology philosophy linguistics cognitive and social psychology neuroscience computer science to submit their proposals The second aim of this Research Topic is to focus on some challenges that in our opinion embodied and grounded theories of cognition need to face First we believe that one important challenge for EC and GC views is to account for the way the so called abstract concepts and abstract words are represented Evidence on the representation of concrete concepts and words is compelling whereas evidence on abstract concepts representation is still too scarce and limited to restricted domains We therefore welcome proposals dealing with this complex issue Second we think that embodied and grounded theories of cognition would need to formulate more precise hypotheses and that in general within the field a larger theoretical effort should be made It is striking that even if a lot of work in the field of computational modelling and robotics starts from an embodied approach experimental and modelling work on embodied cognition remain somehow separate We therefore invite researchers to submit papers proposing models which might help to explain phenomena as well as to constrain and specify in more detail the predictions and the claims advanced within the framework of EC and GC theories

Emerging Technologies for Next Generation Learning Spaces Bosede Iyiade Edwards, Nurbiha A. Shukor, Adrian David Cheok, 2021-08-07 This book discusses the development of the next generation learning spaces with emerging technologies These spaces result from the combined needs of classroom stakeholders such as instructors and learners with classroom elements such as tools and technologies pedagogy and content The book presents discussions and studies on issues possibilities and implications of these changes for next generation education Novel ideas and studies on these all encompassing blended roles of technologies in next generation learning spaces are clearly presented Suggestions on how the benefits they offer can be maximized are also discussed Engaging learning technologies have remained central in education for assisting instructors to teach and learners to learn more effectively However recent technological growth is creating a system in which previous divides between key classroom concepts and stakeholders are getting progressively blurred This is giving rise to next generation learning spaces where elements and stakeholders are blended into one The book addresses the future of learning environments based on these perspectives

The role of body and environment in cognition Dermot Lynott, Judith Holler, Louise Connell, 2014-08-25 Recent evidence has shown many ways in which our bodies and the environment influence cognition In this Research Topic we aim to develop our understanding of cognition by considering the diverse and dynamic relationship between the language we use our bodily perceptions and our actions and interactions in the broader environment There are already many empirical effects illustrating the continuity of mind body environment manipulating body posture influences diverse areas such as mood hormonal responses and perception of risk directing attention to a particular sensory modality can affect language processing signal detection and memory performance placing implicit cues in the environment can impact upon social behaviours moral judgements and economic decision making This Research Topic includes papers that explore the question of how our bodies and the environment influence cognition

Memory HTM Current opinion raises question marks as to whether this theory is sound feasible coherent logical and correct This work aims to if not answer some of those questions at least get closer to understanding the brain and therefore implementing HTM theory in software for further use in an embedded environment The final output of this thesis is a Hierarchical Temporal node designed in software and demonstrating learning using pseudo random input sensory data and the spatial temporal framework The long and short of mental time travel-- self-projection over time-scales large and small James M. Broadway, Claire M. Zedelius, Jonathan W. Schooler, Simon Grondin, 2015-07-02 Researchers working in many fields of psychology and neuroscience are interested in the temporal structure of experience as well as the experience of time at scales of a few milliseconds up to a few seconds as well as days months years and beyond This Research Topic supposes that broadly speaking the field of time psychology can be organized by distinguishing between perceptual and conceptual time scales Dealing with conceptual time mental time travel also called mental simulation self projection episodic semantic memory propection foresight allows humans and perhaps other animals to imagine and plan events and experiences in their personal futures based in large part on memories of their personal pasts as well as general knowledge Moreover contents of human language and thought are fundamentally organized by a temporal dimension enmeshed with it so thoroughly that it is usually expressible only through spatial metaphors But what might such notions have to do with experienced durations of events lasting milliseconds up to a few seconds during the so called present moment of perception action cycle time This Research Topic is organized around the general premise that by considering how mental time travel might scale down to time perception and vice versa no less progress and integrative synthesis within and across scientific domains might be facilitated Bipolar configurations of future and past orientations of the self may be repeated in parallel across conceptual and perceptual time scales subsumed by a general Janus like feedforward feedback system for goal pursuit As an example it is notable that the duality of propection and semantic episodic memory operating at conceptual time scales has an analogue in perception action cycle time namely the interplay of anticipatory attention and working memory Authors from all areas of psychology and neuroscience are encouraged to submit articles of any format accepted by the journal Original Research Methods Hypothesis Theory Reviews etc which might speak to questions about time and temporal phenomena at long and or short time scales *The Spatial Metric of Brain Underlying the Temporal Metric of EEG and Thought* Volkmar Weiss, 2020
