Interface and Transport Dynamics Heike Emmerich, Britta Nestler, Michael Schreckenberg, 2013-03-09 The workshop on computational physics of transport and interfacial dynamics was held in Dresden Germany from February 25 to March 8 2002 The Max Planck Institute for the Physics of Complex Systems has sponsored the workshop and the preliminary lecture based seminar The workshop has closely pursued the recent progress of research in computational physics and materials science particularly in modelling both traffic flow phenomena and complex multi scale solidification These branches of science have become topics of considerable diversity linking disciplines as different as physics mathematical and computational modelling nonlinear dynamics materials sciences statistical mechanics and foundry technique The international workshop brought together experts from different fields in order to enhance the exchange of knowledge to assess common interests and to provide closer cooperation between different communities of researchers The workshop intended to create a comprehensive and coherent image of the current research status and to formulate various possible perspectives for joint future activities Special emphases laid on exchanging experiences

concerning numerical tools and on the bridging of the scales as necessary in a variety of scientific and engineering applications. An interesting possibility along this line was the coupling of different computational approaches leading to hybrid simulations. In this sense we explicitly addressed researchers working with different numerical schemes as diverse as cellular automata, coupled maps, finite difference and finite element algorithms for partial differential equations, e.g. phase field computations.

Stochastic Transport in Complex Systems Andreas Schadschneider, Debashish Chowdhury, Katsuhiko Nishinari, 2010-10-01. The first part of the book provides a pedagogical introduction to the physics of complex systems driven far from equilibrium. In this part we discuss the basic concepts and theoretical techniques which are commonly used to study classical stochastic transport in systems of interacting driven particles. The analytical techniques include mean field theories, matrix product ansatz, renormalization group, etc. and the numerical methods are mostly based on computer simulations. In the second part of the book these concepts and techniques are applied not only to vehicular traffic but also to transport and traffic-like phenomena in living systems ranging from collective movements of social insects (for example ants on trails) to intracellular molecular motor transport. These demonstrate the conceptual unity of the fundamental principles underlying the apparent diversity of the systems and the utility of the theoretical toolbox of non-equilibrium statistical mechanics in interdisciplinary research far beyond the traditional disciplinary boundaries of physics. Leading industry experts provide a broad overview of the interdisciplinary nature of physics. Presents unified descriptions of intracellular and vehicular traffic from a physics point of view. Applies theoretical methods in practical everyday situations. Reference and guide for physicists, engineers, and graduate students.

Coping with Complexity: Model Reduction and Data Analysis Alexander N. Gorban, Dirk Roose, 2010-10-21. This volume contains the extended version of selected talks given at the international research workshop *Coping with Complexity: Model Reduction and Data Analysis* Ambleside, UK, August 31–September 4, 2009. The book is deliberately broad in scope and aims at promoting new ideas and methodological perspectives. The topics of the chapters range from theoretical analysis of complex and multiscale mathematical models to applications in, e.g., fluid dynamics and chemical kinetics.

Adaptive Mesh Refinement - Theory and Applications Tomasz Plewa, Timur Linde, V. Gregory Weirs, 2005-12-20. Advanced numerical simulations that use adaptive mesh refinement (AMR) methods have now become routine in engineering and science. Originally developed for computational fluid dynamics applications, these methods have propagated to fields as diverse as astrophysics, climate modeling, combustion, biophysics, and many others. The underlying physical models and equations used in these disciplines are rather different, yet algorithmic and implementation issues facing practitioners are often remarkably similar. Unfortunately, there has been little effort to review the advances and outstanding issues of adaptive mesh refinement methods across such a variety of fields. This book attempts to bridge this gap. The book presents a collection of papers by experts in the field of AMR who analyze past advances in the field and evaluate the current state of adaptive mesh refinement methods in scientific computing.

Multiresolution Methods in Scattered Data Modelling Armin Iske, 2012-12-06 This application oriented work concerns the design of efficient robust and reliable algorithms for the numerical simulation of multiscale phenomena To this end various modern techniques from scattered data modelling such as splines over triangulations and radial basis functions

are combined with customized adaptive strategies which are developed individually in this work. The resulting multiresolution methods include thinning algorithms, multi level approximation schemes and meshfree discretizations for transport equations. The utility of the proposed computational methods is supported by their wide range of applications such as image compression, hierarchical surface visualization and multiscale flow simulation. Special emphasis is placed on comparisons between the various numerical algorithms developed in this work and comparable state of the art methods. To this end, extensive numerical examples mainly arising from real world applications are provided. This research monograph is arranged in six chapters: 1 Introduction, 2 Algorithms and Data Structures, 3 Radial Basis Functions, 4 Thinning Algorithms, 5 Multilevel Approximation Schemes, 6 Meshfree Methods for Transport Equations. Chapter 1 provides a preliminary discussion on basic concepts, tools and principles of multiresolution methods, scattered data modelling, multilevel methods and adaptive irregular sampling. Relevant algorithms and data structures such as triangulation methods, heaps and quadrees are then introduced in Chapter 2.

High Order Nonlinear Numerical Schemes for Evolutionary PDEs Rémi Abgrall, Héloïse Beaugendre, Pietro Marco Congedo, Cécile Dobrzynski, Vincent Perrier, Mario Ricchiuto, 2014-05-19. This book collects papers presented during the European Workshop on High Order Nonlinear Numerical Methods for Evolutionary PDEs HONOM 2013 that was held at INRIA Bordeaux Sud Ouest Talence France in March 2013. The central topic is high order methods for compressible fluid dynamics. In the workshop and in this proceedings, greater emphasis is placed on the numerical than the theoretical aspects of this scientific field. The range of topics is broad, extending through algorithm design, accuracy, large scale computing, complex geometries, discontinuous Galerkin, finite element methods, Lagrangian hydrodynamics, finite difference methods and applications and uncertainty quantification. These techniques find practical applications in such fields as fluid mechanics, magnetohydrodynamics, nonlinear solid mechanics and others for which genuinely nonlinear methods are needed.
