Applied Turbulence Modelling In Marine Waters:

Applied Turbulence Modelling in Marine Waters Hans Burchard, 2002-09-23 The simulation of turbulent mixing processes in marine waters is one of the most pressing tasks in oceanography. It is rendered difficult by the various complex phenomena occurring in these waters like strong stratification, external and internal waves, wind generated turbulence, Langmuir circulation etc. The need for simulation methods is especially great in this area because the physical processes cannot be investigated in the laboratory. Traditionally empirical bulk type models were used in oceanography which however cannot account for many of the complex physical phenomena occurring. In engineering statistical turbulence models describing locally the turbulence mixing processes were introduced in the early seventies such as the $k-\epsilon$ model which is still one of the most widely used models in Computational Fluid Dynamics. Soon after turbulence models were applied more and more also in the atmospheric sciences and here the $k-\kappa$ model of Mellor and Yamada became particularly popular. In oceanography statistical turbulence models were introduced rather late i.e. in the eighties and mainly models were taken over from the fields mentioned above with some adjustments to the problems occurring in marine waters. In the literature on turbulence model applications to oceanography problems controversial findings and claims are reported about the various models creating also an uncertainty on how well the models work in marine water problems.
