Sciences and Resources, Committee on Geological and Geotechnical Engineering, Committee on Long-Term Management of the Spirit Lake/Toutle River System in Southwest Washington, 2018-04-29 The 1980 eruption of Mount St Helens in southwest Washington State radically changed the physical and socio economic landscapes of the region The eruption destroyed the summit of the volcano sending large amounts of debris into the North Fork Toutle River and blocking the sole means of drainage from Spirit Lake 4 miles north of Mount St Helens As a result of the blockage rising lake levels could cause failure of the debris blockage putting the downstream population of approximately 50 000 at risk of catastrophic flooding and mud flows Further continued transport of sediment to the river from volcanic debris deposits surrounding the mountain reduces the flood carrying capacity of downstream river channels and leaves the population vulnerable to chronic flooding The legacy of the 1980 eruption and the prospect of future volcanic seismic and flood events mean that risk management in the Spirit Lake Toutle River system will be challenging for decades to come This report offers a decision framework to support the long term management of risks related to the Spirit Lake and Toutle River system in light of the different regional economic cultural and social priorities and the respective roles of federal tribal state and local authorities as well as other entities and groups in the region It also considers the history and adequacy of characterization monitoring and management associated with the Spirit Lake debris blockage and outflow tunnel other efforts to control transport of water and sediment from the 1980 and later eruptions and suggests additional information needed to support implementation of the recommended decision framework

Wetlands and Water Resources: Ecological Solutions for the Environment Guangzhi Sun, Xiaofei Yu, Yuanchun Zou, Guobin Fu, 2023-04-12 Wetlands are usually located in complex landscapes Multiple ecosystem services delivered by wetlands to human well being should be considered in broader contexts of wetland functions water quality water resource management and wetland conservation Natural wetlands are kidneys and sponges of the earth that remove water pollutants and provide hydrological regulation functions vital to the environment Where the functions of the wetlands are weakened actions of rehabilitations are needed to revitalize those functions While worldwide many natural wetlands have disappeared due to climate change and or human activities constructed wetlands which may be seen as artificial kidneys sponges of the earth have been increasingly built to replicate the functions of the natural wetlands This Research Topic aims to collect and present the latest research developments in natural and constructed wetlands in relation to either water resource functions or water quality Articles published in this Research Topic will showcase new understandings of water balances and flow patterns vegetation characteristics and pollutant transformations in wetland systems innovative designs and efficiencies of wastewater treatment wetlands and technologies that revitalize the ecosystem functions of natural wetlands These articles are expected to bring benefits to research communities water and wastewater industries and government agencies that deal with wetland water management and conservation High quality Original Research and Review articles in this field are all welcome for submission to this Research

Topic Research interests include but are not limited to the following areas 1 Water balances and flow patterns in natural wetland systems 2 The hydrological regulation functions and importance of natural wetlands in their environmental context 3 Vegetation characteristics of natural wetlands and their functional importance in wetland water pollution control 4 Techniques for the rehabilitation of degraded wetlands 5 The role of constructed wetlands in wastewater treatment 6 Innovative designs and efficiencies of wastewater treatment wetlands 7 The modeling of hydrological and or pollutant dynamics in wetland systems 8 The ecohydrology of wetlands 9 The role of wetlands in the global carbon cycle 10 Impacts of climate change and human activities on wetland hydrology and water resources Recognizing that hydrological and biogeochemical processes are basically coupled in wetlands and their landscapes manuscripts that report their interactions are particularly welcome

Buiter, 2019-11-11 Fifty years ago Tuzo Wilson published his paper asking Did the Atlantic close and then re open This led to the Wilson Cycle concept in which the repeated opening and closing of ocean basins along old orogenic belts is a key process in the assembly and breakup of supercontinents The Wilson Cycle underlies much of what we know about the geological evolution of the Earth and its lithosphere and will no doubt continue to be developed as we gain more understanding of the physical processes that control mantle convection plate tectonics and as more data become available from currently less accessible regions This volume includes both thematic and review papers covering various aspects of the Wilson Cycle concept Thematic sections include 1 the Classic Wilson v Supercontinent Cycles 2 Mantle Dynamics in the Wilson Cycle 3
