just a catalog of theorems The author begins with the basics then takes students on a fascinating journey from conics higher algebraic and transcendental curves through the properties of parametric curves the classification of lima ons envelopes and finally to projective curves their relationship to algebraic curves and their application to asymptotes and boundedness The uniqueness of this treatment lies in its integration of the different types of curves its use of analytic methods and its generous number of examples exercises and illustrations The result is a practical text almost entirely self contained that not only imparts a deeper understanding of the theory but inspires a heightened appreciation of geometry and interest in more advanced studies
