The book presents a full set of characteristics and requirements for all types of aircraft systems, including avionics, mission and supporting ground systems, in a single volume. Readers can delve further into specific topics by referencing the detailed glossary and bibliography. To aid in reader comprehension, each aircraft system is broken down according to various criteria, such as Purpose, description, and safety; Integration with other systems; Key interfaces and design drivers; Modeling and simulation; Best practices; and future trends. Written for aerospace professionals, researchers, and advanced students with some existing knowledge of the aircraft industry, this book allows readers to quickly reference information on every aspect of aircraft systems. **Aerospace Actuators 3** Jean-Charles Maré, 2018-03-13 This book is the third in a series dedicated to aerospace actuators. It uses the contributions of the first two volumes to conduct case studies on actuation for flight controls, landing gear, and engines. The actuation systems are seen in several aspects: signal and power architectures, generation and distribution of hydraulic or mechanical power, control and reliability, and evolution towards more electrical systems. The first three chapters are dedicated to the European commercial airplanes that marked their era: Caravelle, Concorde, Airbus A320, and Airbus A380. The final chapter deals with the flight controls of the Boeing V-22 and AgustaWestland AW609 tiltrotor aircraft. These address concerns that also apply to electromechanical actuators, which should be fitted on more electrical aircraft in the future. The topics covered in this series of books constitute a significant source of information for individuals.
