

STATES OF MATTER

- Properties of the particles in a solid, liquid and gas:

Solid

SOLID:

1. All particles are touching.
2. The particles are very closely packed.
3. The particles are arranged in a regular pattern.

MOVEMENT

The particles Vibrate at a fixed position

Liquid

LIQUID:

1. All particles are touching.
2. The particles are closely packed.
3. The particles are arranged in a random pattern.

MOVEMENT

The particles move around each other.

Gas

GAS:

1. All particles are not touching at all.
2. The particles are spaced far apart.
3. The particles are arranged in a random pattern.

- Changes in states of matter:

Melting:

The particles in a solid gain heat and vibrate faster until the particles overcome the attractive forces between them. The particles begin to break away from their fixed position, slide over one another and form liquid.

Boiling:

As the liquid is heated, the particles in it gain kinetic energy and start moving faster. The particles use their energy to overcome the attractive force between them they spread far apart and move rapidly in all directions and the substance is now gas.

Condensation:

The particles in a gas lose heat and the particles move more slowly, get closer to each other. The particles become slow enough for the gas to change into liquid.

Evaporation:

Different from boiling, evaporation can happen in any temperature, though evaporation took more time. Evaporation occurs when the particles of the liquid have enough energy to escape as gas from the surface of the liquid.

Freezing:

The particles in a liquid lose heat, the particles move more slowly, get closer to each other and have a stronger attractive force between each other. The particles begin to stay in a fixed position and form solid.

Sublimation:

When a substance (usually iodine, ammonium chloride and dry ice or solid carbon dioxide) sublimates, it's because the forces between the particles in the liquid state are too weak to remain in this state.
