Nollet,2006-08-21 As radiological residue both naturally occurring and technologically driven works its way through the ecosystem we see its negative effects on the human population Radionuclide Concentrations in Food and the Environment addresses the key issues concerning the relationship between natural and manmade sources of environmental radioactivity their transportation through the ecosystem and the subsequent radionuclide concentrations in foods and the human population The book discusses the negative effects of environmental radioactivity on plants and animals as well as the effects of radiocontaminated food on human health and perspectives for transfer prevention Beginning with the fundamentals of matter and the behavior of particles the text lays a solid foundation for discussions on the source of radionuclides and their concentrations in air water and soil Using predictive modeling the authors examine the transfer of radionuclides through ecosystems and their effects on individual substances The book provides up to date information on monitoring programs and legislation detailed descriptions of detection systems and evaluations of safety protocols in radioanalytical laboratories and in food processing The authors devote considerable attention to the nuclear and radiological terrorist threat illicit trafficking and masking of radioactive materials event scenarios and radiological forensics **Tables of Factors for Correcting for Radioactive Decay** G. Mitchell,1963 **Environmental Radiochemical Analysis VII** Nicholas Evans,2023-12-08 Incidents such as nuclear weapon tests accidents in nuclear power plants transport accidents and accidental or authorised discharges from nuclear facilities have introduced anthropogenic radionuclides into the environment Scientists need accurate analysis of these radionuclides in order to estimate the risk to the public from released radioactivity This book is an authoritative up to date collection from leading scientists across the globe on environmental radiochemistry and radioecology nuclear industry decommissioning radiation detection and imaging medical imaging radioanalytical techniques and nuclear forensics The research contributions were first presented at the 14th International Symposium on Nuclear and Environmental Radiochemical Analysis in September 2022 Providing a key reference for graduates and professionals who work across fields involving analytical chemistry radiochemistry environmental science and technology and waste disposal this book is essential reading to aid risk analysis and protection **Chemical Aspects of the Radioactive Decay 38S 38Cl** Cornelis Johannes Leurs,1978 **Environmental Effects on Radioactive Decay Rates** Richard Allan Porter,1959 Chemical Effects in

the Radioactive Decay Te 132-132 Charles J. Cummiskey,1956 *Beta-decay Energetics and Nuclear Systematics* Richard Conrad Fix,1956 **Examination of Radioactive Decay Methodology in the HASCAL Code** ,1998 The HASCAL 2.0 code provides dose estimates for nuclear chemical and biological facility accident and terrorist weapon strike scenarios. In the analysis of accidents involving radioactive material an approximate method is used to account for decay during transport. Rather than perform the nuclide decay during the atmospheric transport calculation the decay is performed a priori and a table look up method is used during the transport of a depositing tracer particle and non depositing gaseous tracer particle. In order to investigate the accuracy of this decay methodology two decay models were created using the ORIGEN2 computer program. The first is a HASCAL like model that treats decay and growth of all nuclide explicitly over the time interval specified for atmospheric transport but does not change the relative mix of depositing and non depositing nuclides due to deposition to the ground nor does it treat resuspension. The second model explicitly includes resuspension as well as separate decay of the nuclides in the atmosphere and on the ground at each deposition time step. For simplicity both of these models uses a one dimensional layer model for the atmospheric transport. An additional investigation was performed to determine the accuracy of the HASCAL like model in separately following Cs 137 and I 131. The results from this study show that the HASCAL decay model compares closely with the more rigorous model with the computed doses are generally within one percent maximum error of 7 percent over 48 hours following the release. The models showed no difference for Cs 137 and a maximum error of 2.5 percent for I 131 over the 96 hours following release **Becquerel's Legacy** M. C. O'Riordan,1996
