Statistical Models for Test Equating, Scaling, and Linking Alina von Davier, 2010-10-19 The goal of this book is to emphasize the formal statistical features of the practice of equating linking and scaling The book encourages the view and discusses the quality of the equating results from the statistical perspective new models robustness fit testing hypotheses statistical monitoring as opposed to placing the focus on the policy and the implications which although very important represent a different side of the equating practice The book contributes to establishing equating as a theoretical field a view that has not been offered often before The tradition in the practice of equating has been to present the knowledge and skills needed as a craft which implies that only with years of experience under the guidance of a knowledgeable practitioner could one acquire the required skills This book challenges this view by indicating how a good equating framework a sound understanding of the assumptions that underlie the psychometric models and the use of

statistical tests and statistical process control tools can help the practitioner navigate the difficult decisions in choosing the final equating function This book provides a valuable reference for several groups a statisticians and psychometricians interested in the theory behind equating methods in the use of model based statistical methods for data smoothing and in the evaluation of the equating results in applied work b practitioners who need to equate tests including those with these responsibilities in testing companies state testing agencies and school districts and c instructors in psychometric measurement and psychology programs
