Hall,2008-09-15 Long ago fish fins evolved into the limbs of land vertebrates and tetrapods During this transition some elements of the fin were carried over while new features developed Lizard limbs bird wings and human arms and legs are therefore all evolutionary modifications of the original tetrapod limb A comprehensive look at the current state of research on fin and limb evolution and development this volume addresses a wide range of subjects including growth structure maintenance function and regeneration Divided into sections on evolution development and transformations the book begins with a historical introduction to the study of fins and limbs and goes on to consider the evolution of limbs into wings as well as adaptations associated with specialized modes of life such as digging and burrowing Fins into Limbs also discusses occasions when evolution appears to have been reversed in whales for example whose front limbs became flippers when they reverted to the water as well as situations in which limbs are lost such as in snakes With contributions from world renowned researchers Fins into Limbs will be a font for further investigations in the changing field of evolutionary developmental biology *Vestibular System Part 1: Basic Mechanisms* H.H. Kornhuber,2012-12-06 The details of the receptor mechanism

are not yet fully understood for any sensory system However sufficient data are available for the vestibular system and for other systems to permit meaningful tracking of the sensory messages through the nervous system and via conscious experience The reception process ing storage and output of information in man and other animals as done by means of receptors neurons secretory cells and muscle fibers are collectively referred to as mind Sensory physiologists tend to disbelieve in extrasensory perception Sensory physiology in general is an area upon which different sciences and methods converge Anatomists physiologists psychologists physicists chemists and engineers have made important contributions to sensory physiology What is special about vestibular physiology is the fact that many research workers are clinicians living under the constant pressure of their patient s demands This is a disadvantage when it comes to writing handbooks but an

advantage for the patient since research is guided by clinical practice and can be quickly applied. Modern methods such as recording from single nerve units and the correlation of electrophysiological and psychophysical data have greatly contributed to our knowledge yet the study of lesions is still important especially in the vestibular field. Pulker, 2013-06-29 Interference coatings are an essential part of modern optics. This book is designed to give a concise but complete overview of the field with contributions written by leading experts in the various areas. Topics include design materials, film growth, deposition including large area characterization and monitoring and mechanical stress. The authors also describe applications in astronomy, microcomponents, DUV, VUV, EUV, X-ultrafast optics, displays and ultrasensitive fluorescence. Furthermore, laser-resistant coatings and coatings for free electron lasers and plastic optics are covered. The book concludes with chapters on photonic structures as interference devices and on the brilliant world of natural coatings. Comparative Anatomy of the Vertebrates George Cantine Kent, 1965
