The Water Cycle

Water flows through various pathways on our planet, shaping landscapes and sustaining life. The amount of water on Earth always stays relatively the same – it just moves from one area of the Earth's surface or atmosphere to another. Have you ever wondered how water moves from oceans to clouds to rivers and back again? That journey, known as the water cycle or hydrologic cycle, is driven by two powerful forces: the energy of the Sun and the force of gravity.

Evaporation

The water cycle begins with the warmth of the Sun heating up bodies of water such as oceans, lakes, and rivers. This heat makes some of the liquid water turn into a gas called water vapor, rising into the air. This process is called evaporation. As water vapor is added to the air, it increases the atmosphere's moisture content, or humidity. Humidity is a measure of the amount of water vapor present in the air. Warmer air can hold more moisture than cooler air, so humidity levels tend to be higher in warm and tropical climates.

Sublimation

Sometimes, water vapor can enter the atmosphere directly from a solid surface, such as ice or snow, through a process called sublimation. This allows water to move from the ground to the air without melting first.

Precipitation

Clouds continue to build up as more and more water vapor condenses. Eventually, the cloud droplets or ice crystals grow large enough to overcome the upward air currents that keep them suspended in the atmosphere. When this happens, the droplets or crystals begin to fall from the clouds due to gravity. Precipitation can take the form of water, such as rain, snow, sleet, or hail, or it can fall as ice crystals.

Water can fall as rain, where the temperature is above freezing, or as snow, where the temperature is below freezing. Precipitation that reaches the ground is called runoff. Other types of precipitation include sleet and hail, which forms when water droplets freeze together in the atmosphere.

Water can also fall as snow or sleet, which may fall as rain, where the temperature is above freezing, or as snow, where the temperature is below freezing. Precipitation that reaches the ground is called runoff. Other types of precipitation include sleet and hail, which forms when water droplets freeze together in the atmosphere.
