The Oxford Handbook of Sleep and Sleep Disorders Colin A. Espie, Phyllis C. Zee, Charles M. Morin, 2025-05-27

Sleep is one of life's fundamental requirements and like oxygen, water, and food, we simply cannot live without it. Sleep is essential for tissue repair, metabolism, growth, infection control, and for learning, memory, and emotional regulation. Moreover, these critical functions of sleep remain true across the lifespan. In many ways, sleep is nature's medicine; it is what nature has provided to deliver daytime functioning and to maintain health and wellbeing.

The Oxford Handbook of Sleep and Sleep Disorders has been carefully collated by its internationally renowned editors to provide a comprehensive and up-to-date guide to our understanding of sleep and circadian processes and of the clinical disorders of sleep and sleep/wake regulation. The handbook therefore covers what sleep is and why it matters but also explains the disorders of sleep and how they can be assessed, differentiated, and treated.

Comprising 46 chapters, each written by leading experts in their field, the handbook is organized around four sections:

1. the fundamentals of sleep and circadian processes
2. the roles and functions of sleep
3. societal factors influencing sleep
- and 4. disorders of sleep and circadian function.

This final section is further subdivided into several components, including epidemiology, classification, and assessment; management and treatment; and lifespan issues and special populations. Taken

together the handbook offers clinicians and scientists the most contemporary and authoritative single resource for clinical practice and for research in the developing fields of sleep science and sleep medicine

Zander, Jan B. F. van Erp, 2015-07-27 What can we learn from spontaneously occurring brain and other physiological signals about an individual s cognitive and affective state and how can we make use of this information One line of research that is actively involved with this question is Passive Brain Computer Interfaces BCI To date most BCIs are aimed at assisting patients for whom brain signals could form an alternative output channel as opposed to more common human output channels like speech and moving the hands However brain signals possibly in combination with other physiological signals also form an output channel above and beyond the more usual ones they can potentially provide continuous online information about an individual s cognitive and affective state without the need of conscious or effortful communication The provided information could be used in a number of ways Examples include monitoring cognitive workload through EEG and skin conductance for adaptive automation or using ERPs in response to errors to correct for a behavioral response While Passive BCIs make use of online neuro physiological responses and close the interaction cycle between a user and a computer system neuro physiological responses can also be used in an offline fashion Examples of this include detecting amygdala responses for neuromarketing and measuring EEG and pupil dilation as indicators of mental effort for

optimizing information systems The described field of applied neuro physiology can strongly benefit from high quality scientific studies that control for confounding factors and use proper comparison conditions Another area of relevance is ethics ranging from dubious product claims acceptance of the technology by the general public privacy of users to possible effects that these kinds of applications may have on society as a whole In this Research Topic we aimed to publish studies of the highest scientific quality that are directed towards applications that utilize spontaneously effortlessly generated neurophysiological signals brain and or other physiological signals reflecting cognitive or affective state We especially welcomed studies that describe specific real world applications demonstrating a significant benefit compared to standard applications We also invited original new kinds of proposed applications in this area as well as comprehensive review articles that point out what is and what is not possible according to scientific standards in this field Finally we welcomed manuscripts on the ethical issues that are involved Connected to the Research Topic was a workshop held on June 6 during the Fifth International Brain Computer Interface Meeting June 3 7 2013 Asilomar California that brought together a diverse group of people who were working in this field We discussed the state of the art and formulated major challenges as reflected in the first paper of the Research Topic
