

Unconsciousness is a state of unresponsiveness, where the casualty is unaware of their surroundings and no purposeful response can be obtained.

- Cause of an unresponsive (unconscious), breathing state:**
- A - Alcohol
 - T - Trauma (head injury) (Pg 20, 21)
 - E - Epilepsy (Pg 24)
 - I - Infection (meningitis)
 - S - Stroke (Pg 27)
 - B - Brain (Disease) (Pg 26)
 - P - Pretending
 - O - Overdose (Poison) (Pg 28)
 - U - Unknown (renal failure)

129. The source of hearing is usually the first source to go, so the careful what you say here on premonitory remarks.

All unconscious casualties must be handled gently and every effort made to avoid any twisting or forward movement of the head and spine.

(An asthmatic, breathing woman in advanced pregnancy should be placed on her left side.)

These two primary goals can be

- Maintains a clear airway - allows the tongue to fall forward.
- Facilitates drainage and lessens the risk of inhaling foreign material (eg saliva, vomit)
- Permits good observation and access to the airway
- Avoids pressure on the chest which facilitates breathing.
- Provides a stable position and minimises injury to casualty

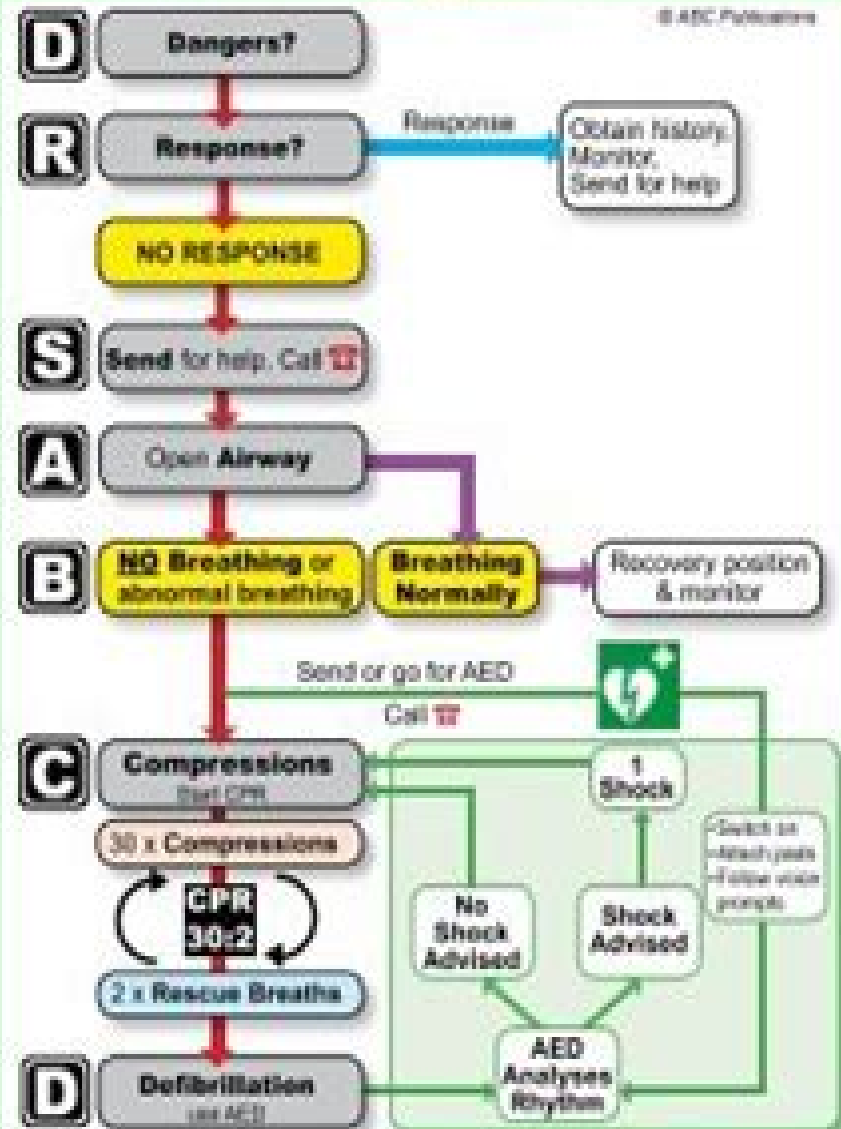

- Raise the casualty's left hand arm above the head.
- Place the casualty's nearest arm across the body.
- Bend-up the casualty's nearest leg.
- With one hand on the shoulder and the other on the knee, roll casualty away from you.

- Stabilize the casualty by flexing the head back to 90° when resting on the ground
- Tuck the casualty's hand under their armpit
- Ensure the casualty's head is resting on their outstretched arm

- Carefully tilt the head slightly backwards and downwards. This facilitates drainage of saliva and/or stomach contents and reduces the risk of aspiration which may cause pneumonia.
