ANSWER--cuvettes are usually made of plastic, glass and quartz

Know all the differences and the advantages of Chemical ionization and Electron Impact

- ANSWER-Electron Ionization:

- ionization is direct result of impact of high-energy electrons with analyte molecule
- can be used for organic and inorganic compounds
- causes significant fragmentation in analyte
- it is possible for fragments to collide which may produce new fragments that do not represent the bond structure of the original precursor molecule (decrease pressure of the system to avoid this; less molecules available for collision, less collisions of fragments)
- hard ionization

Chemical Ionization:

-soft ionization

- ionization results from collision of analyte molecules with ions of a reagent gas that is introduced to the ionization chamber
- reagent gas is ionized with Electron ionization
- reagent gas = methane, ammonia, isobutane
- electrons in EI of reagent gas are much higher in energy than in typical EI (70 eV vs. 200 V)
- negative ion ionization is common (unlike EI)- this is bc reagent gas slows electrons down enough so they can be captured
- NCl (negative chem. ionization) is common for halogenated cmpds
