Positive Transfer Operators and Decay of Correlations Viviane Baladi, 2000 Although individual orbits of chaotic dynamical systems are by definition unpredictable the average behavior of typical trajectories can often be given a precise statistical description Indeed there often exist ergodic invariant measures with special additional features For a given invariant measure and a class of observables the correlation functions tell whether and how fast the system mixes i e forgets its initial conditions This book addressed to mathematicians and mathematical or mathematically inclined physicists shows how the powerful technology of transfer operators imported from statistical physics has been used recently to construct relevant invariant measures and to study the speed of decay of their correlation functions for many chaotic systems Links with dynamical zeta functions are explained The book is intended for graduate students or researchers entering the field and the technical prerequisites have been kept to a minimum

Open Systems and Measurement in Relativistic Quantum Theory Heinz-Peter Breuer, Francesco Petruccione, 1999-06-21 This book treats modern aspects of open systems measurement and decoherence in relativistic quantum theory It starts with a comprehensive introduction to the problems related to measuring local and nonlocal observables and the constraints imposed by the causality principle In the articles that follow the emphasis lies on new theoretical models Quantum dynamical semigroups and stochastic processes in Hilbert space are introduced as are dynamical reduction models Further topics include relativistic generalizations of the continuous spontaneous localization model and of the quantum state diffusion model and decoherence and the dynamical selection of preferred basis sets in the framework of continuous measurement theory and of the decoherent histories approach Mathematical aspects of quantum measurement theory and dynamical entropies are also studied from the viewpoint of the operational approach to quantum mechanics

Theory and Formal Methods 1993 Geoffrey Burn, Simon Gay, Mark Ryan, 2012-12-06 This volume contains the proceedings of the first workshop held by the Theory and Formal Methods Section of the Imperial College Department of Computing It contains papers from almost every member of the Section from our long term academic visitors and from those who have recently left us The papers fall into four broad areas semantics concurrency logic specification with some papers spanning a number of disciplines The subject material varies from work on mathematical foundations to practical applications of this theory expressing the Section's commitment to both the foundations of computer science and the application of theory to real computing problems In preparing the workshop and these proceedings care was taken to ensure that there were papers over-viewing a field as well as ones whose primary aim was to present new scientific results This had a dual purpose to bring our Section members up to speed in some of the areas being worked on by the Section and to provide the reader of the

proceedings not only with a good introduction to many of the specific areas being investigated by the Section but also with details of some of our latest results. All the papers presented at the workshop were revised following comments made by the workshop participants and all were subsequently reviewed by at least two people before producing the final versions contained in this volume.

Self-similar and Self-affine Sets and Measures Balázs Bárány, Károly Simon, Boris Solomyak, 2023-11-16 Although there is no precise definition of a fractal it is usually understood to be a set whose smaller parts when magnified resemble the whole. Self similar and self affine sets are those for which this resemblance is precise and given by a contracting similitude or affine transformation. The present book is devoted to this most basic class of fractal objects. The book contains both introductory material for beginners and more advanced topics which continue to be the focus of active research. Among the latter are self similar sets and measures with overlaps including the much studied infinite Bernoulli convolutions. Self affine systems pose additional challenges their study is often based on ergodic theory and dynamical systems methods. In the last twenty years there have been many breakthroughs in these fields and our aim is to give introduction to some of them often in the simplest nontrivial cases. The book is intended for a wide audience of mathematicians interested in fractal geometry including students. Parts of the book can be used for graduate and even advanced undergraduate courses.

Recent Developments in Fractals and Related Fields Julien Barral, Athanasios Batakis, Stéphane Seuret, 2025-04-18 This volume provides readers with an overview of the most recent developments in the mathematical fields related to fractals. It includes both original research contributions as well as surveys from many of the leading experts on modern fractal geometry theory and applications. The contributions contained in the book stem from the conference Fractals and Related Fields IV that was held in 2022 on the Island of Porquerolles, France. Various aspects of fractal geometry in connection with harmonic analysis, geometric measure theory, ergodic theory and dynamical systems, probability theory, number theory, functional analysis, additive combinatorics, embedding theory and signal and image processing are addressed within its pages. We hope that the book will be interesting for pure and applied mathematicians in these areas as well as for other researchers curious to discover more about fractals.

Fractal Dimension for Fractal Structures Manuel Fernández-Martínez, Juan Luis García Guirao, Miguel Ángel Sánchez-Granero, Juan Evangelista Trinidad Segovia, 2019-04-23 This book provides a generalised approach to fractal dimension theory from the standpoint of asymmetric topology by employing the concept of a fractal structure. The fractal dimension is the main invariant of a fractal set and provides useful information regarding the irregularities it presents when examined at a suitable level of detail. New theoretical models for calculating the fractal dimension of any subset with respect to a fractal structure are posed to generalise both the Hausdorff and box counting dimensions. Some specific results for self similar sets are also proved. Unlike classical fractal dimensions these new models can be used with empirical applications of fractal dimension including non Euclidean contexts. In addition the book applies these fractal dimensions to explore long memory in financial markets. In

particular novel results linking both fractal dimension and the Hurst exponent are provided As such the book provides a number of algorithms for properly calculating the self similarity exponent of a wide range of processes including fractional Brownian motion and Levy stable processes The algorithms also make it possible to analyse long memory in real stocks and international indexes This book is addressed to those researchers interested in fractal geometry self similarity patterns and computational applications involving fractal dimension and Hurst exponent **Advances in Applied Probability** ,2003

Finer Thermodynamic Formalism - Distance Expanding Maps and Countable State Subshifts of Finite Type, Conformal GDMSs, Lasota-Yorke Maps and Fractal Geometry Mariusz Urbański, Mario Roy, Sara Munday, 2022-06-06 This book consists of three volumes The first volume contains introductory accounts of topological dynamical systems finite state symbolic dynamics distance expanding maps and ergodic theory of metric dynamical systems acting on probability measure spaces including metric entropy theory of Kolmogorov and Sinai More advanced topics comprise infinite ergodic theory general thermodynamic formalism topological entropy and pressure Thermodynamic formalism of distance expanding maps and countable alphabet subshifts of finite type graph directed Markov systems conformal expanding repellers and Lasota Yorke maps are treated in the second volume which also contains a chapter on fractal geometry and its applications to conformal systems Multifractal analysis and real analyticity of pressure are also covered The third volume is devoted to the study of dynamics ergodic theory thermodynamic formalism and fractal geometry of rational functions of the Riemann sphere

Thermodynamic Formalism Mark Pollicott, Sandro Vaienti, 2021-10-01 This volume arose from a semester at CIRM Luminy on Thermodynamic Formalism Applications to Probability Geometry and Fractals which brought together leading experts in the area to discuss topical problems and recent progress It includes a number of surveys intended to make the field more accessible to younger mathematicians and scientists wishing to learn more about the area Thermodynamic formalism has been a powerful tool in ergodic theory and dynamical system and its applications to other topics particularly Riemannian geometry especially in negative curvature statistical properties of dynamical systems and fractal geometry This work will be of value both to graduate students and more senior researchers interested in either learning about the main ideas and themes in thermodynamic formalism and research themes which are at forefront of research in this area

inorganic the living from the inert Does life evolve along a predestined path or does it suddenly emerge from what appeared lifeless and programmatic In this easily accessible and wide ranging survey Claus Emmeche outlines many of the challenges and controversies involved in the dynamic and curious science of artificial life Emmeche describes the work being done by an international network of biologists computer scientists and physicists who are using computers to study life as it could be or as it might evolve under conditions different from those on earth Many artificial life researchers believe that they can create new life in the computer by simulating the processes observed in traditional biological life forms The flight of a flock of birds for example can be reproduced faithfully and in all its complexity by a relatively simple computer program that is designed to generate electronic boids Are these boids then alive The central problem Emmeche notes lies in defining the salient differences between biological life and computer simulations of its processes And yet if we can breathe life into a computer what might this mean for our other assumptions about what it means to be alive The Garden in the Machine touches on every aspect of this complex and rapidly developing discipline including its connections to artificial intelligence chaos theory computational theory and studies of emergence Drawing on the most current work in the field this book is a major overview of artificial life Professionals and nonscientists alike will find it an invaluable guide to concepts and technologies that may forever change our definition of life
