And T2 :

Stevens' Handbook of Experimental Psychology, Sensation and Perception Steven Yantis, 2002-10-23 Now available in paperback This revised and updated edition of the definitive resource for experimental psychology offers comprehensive coverage of the latest findings in the field as well as the most recent contributions in methodology and the explosion of research in neuroscience Volume One Sensation and Perception focuses on sensory experience and complex learned perceptions through modalities such as vision touch smell and hearing Time Granularities in Databases, Data Mining, and Temporal Reasoning Claudio Bettini, Sushil Jajodia, Sean Wang, 2013-06-29 Calendar units such as months and days clock units such as hours and seconds and specialized units such as business days and academic years play a major role in a wide range of information system applications System support for reasoning about these units called granularities in this book is important for the efficient design use and implementation of such applications The book deals with several aspects of temporal information and provides a unifying model for granularities It is intended for computer scientists and engineers who are interested in the formal models and technical development of specific issues Practitioners can learn about critical aspects that must be taken into account when designing and implementing databases supporting temporal information Lecturers may find this book useful for an advanced course on databases Moreover any graduate student working on time representation and reasoning either in data or knowledge bases should definitely read it A Theory of Social Action R. Tuomela, 1984-09-30 It is somewhat surprising to find out how little serious theorizing there is in philosophy and in social psychology as well as sociology on the nature of social actions or joint actions in the sense of actions performed together by several agents Actions performed by single agents have been extensively discussed both in philosophy and in psychology There is accordingly a booming field called action theory in philosophy but it has so far strongly concentrated on actions performed by single agents only We of course should not forget game theory a discipline that systematically studies the strategic interaction between several rational agents Yet this important theory besides being restricted to strongly rational acting fails to study properly several central problems related to the conceptual nature of social action Thus it does not adequately clarify and classify the various types of joint action except perhaps from the point of view of the agents' utilities This book presents a systematic theory of social action Because of its reliance on so called purposive causation and generation it is called the purposive causal theory This work also discusses several problems related to the topic of social action for instance that of how to create from this perspective the most central concepts needed by social psychology and sociology While quite a lot of ground is covered in the book many important questions have been left unanswered and many others unasked as well Elimination Methods D. Wang, 2001-01-05 This book provides a systematic and uniform presentation of elimination methods and the underlying theories along the central line of decomposing arbitrary systems of polynomials into triangular systems of various kinds Highlighting methods based on triangular sets the book also covers the

theory and techniques of resultants and Gröbner bases The methods and their efficiency are illustrated by fully worked out examples and their applications to selected problems such as from polynomial ideal theory automated theorem proving in geometry and the qualitative study of differential equations The reader will find the formally described algorithms ready for immediate implementation and applicable to many other problems Suitable as a graduate text this book offers an indispensable reference for everyone interested in mathematical computation computer algebra software and systems of algebraic equations

Advances in Superconductivity VII Kaoru Yamafuji, Tadataka Morishita, 2012-12-06 The field of high temperature superconductivity has encouraged an interdisciplinary approach to research It has required significant cooperation and collaboration among researchers each of whom has brought to it a rich variety of experience from many other fields Recently great improvements have been made in the quality of research The subject has matured and been launched into the next stage through the resonance between science and technology The current progress of materials processing and engineering in this field is analogous to that previously seen in the development of semiconductors These include the appearance of materials taking the place of YBa₂Cu₃O₇ owing to their improved properties higher critical temperatures and stronger flux pinning in which rare earth ions with large radii La Nd Sm substitute for Y the development of technology enabling growth control on the nanometer scale and precise and reproducible measurements that can be used as rigorous tests of theoretical models which in turn are expected to lead to the development of new devices For further progress in high T research academics and technologists must pool their knowledge and experience I hope that this volume will promote that goal by providing the reader with the latest results of high temperature superconductor research and will stimulate further discussion and collaboration

Dynamics in Logistics Hans-Jörg Kreowski, Bernd Scholz-Reiter, Klaus-Dieter Thoben, 2013-03-28 The volume comprises the proceedings of the third International Conference on Dynamics in Logistics LDIC 2012 The scope of the conference targeted the identification analysis and description of the dynamics of logistic processes and networks The spectrum ranged from the modeling and planning of processes and innovative methods like autonomous control and knowledge management to the new technologies provided by radio frequency identification mobile communication and networking The growing dynamics in the area of logistics poses completely new challenges Logistic processes and networks must rapidly and flexibly adapt to continuously changing conditions LDIC 2012 provided a venue for researchers from academia and industry interested in the technical advances in dynamics in logistics The conference addressed research in logistics from a wide range of fields e.g. engineering computer science and operations research The volume consists of two invited papers and of 49 contributed papers divided into various subjects including transport logistics routing in dynamic logistic networks modeling simulation optimization and collaboration in logistics identification technologies mathematical modeling in transport and production logistics information communication risk and failure in logistic systems autonomous control in logistic processes global supply chains and

Computability and Complexity Theory

Steven Homer, Alan L. Selman, 2013-03-09 The theory of computing provides computer science with concepts, models, and formalisms for reasoning about both the resources needed to carry out computations and the efficiency of the computations that use these resources. It provides tools to measure the difficulty of combinatorial problems both absolutely and in comparison with other problems. Courses in this subject help students gain analytical skills and enable them to recognize the limits of computation. For these reasons, a course in the theory of computing is usually required in the graduate computer science curriculum. The harder question to address is which topics such a course should cover. We believe that students should learn the fundamental models of computation, the limitations of computation, and the distinctions between feasible and intractable. In particular, the phenomena of NP-completeness and NP-hardness have pervaded much of science and transformed computer science. One option is to survey a large number of theoretical subjects typically focusing on automata and formal languages. However, these subjects are less important to theoretical computer science and to computer science as a whole now than in the past. Many students have taken such a course as part of their undergraduate education. We chose not to take that route because computability and complexity theory are the subjects that we feel deeply about and that we believe are important for students to learn. Furthermore, a graduate course should be scholarly. It is better to treat important topics thoroughly than to survey the field.

Introduction to Privacy-Preserving Data Publishing

Benjamin C.M. Fung, Ke Wang, Ada Wai-Chee Fu, Philip S. Yu, 2010-08-02 Gaining access to high quality data is a vital necessity in knowledge-based decision making. But data in its raw form often contains sensitive information about individuals. Providing solutions to this problem, the methods and tools of privacy-preserving data publishing enable the publication of useful information while protecting data privacy.

Probability with Statistical Applications

Rinaldo B. Schinazi, 2022-02-26 This second edition textbook offers a practical introduction to probability for undergraduates at all levels with different backgrounds and views towards applications. Calculus is a prerequisite for understanding the basic concepts; however, the book is written with a sensitivity to students' common difficulties with calculus that does not obscure the thorough treatment of the probability content. The first six chapters of this text neatly and concisely cover the material traditionally required by most undergraduate programs for a first course in probability. The comprehensive text includes a multitude of new examples and exercises and careful revisions throughout. Particular attention is given to the expansion of the last three chapters of the book with the addition of one entirely new chapter 9 on Finding and Comparing Estimators. The classroom-tested material presented in this second edition forms the basis for a second course introducing mathematical statistics.

Engineering a Compiler

Keith D. Cooper, Linda Torczon, 2003-12-11 The proliferation of processors, environments, and constraints on systems has cast compiler technology into a wider variety of settings, changing the compiler and compiler writer's role. No longer is execution speed the sole criterion for judging compiled code. Today, code might be judged on how small it is, how

much power it consumes how well it compresses or how many page faults it generates In this evolving environment the task of building a successful compiler relies upon the compiler writer's ability to balance and blend algorithms engineering insights and careful planning Today's compiler writer must choose a path through a design space that is filled with diverse alternatives each with distinct costs advantages and complexities Engineering a Compiler explores this design space by presenting some of the ways these problems have been solved and the constraints that made each of those solutions attractive By understanding the parameters of the problem and their impact on compiler design the authors hope to convey both the depth of the problems and the breadth of possible solutions Their goal is to cover a broad enough selection of material to show readers that real tradeoffs exist and that the impact of those choices can be both subtle and far reaching Authors Keith Cooper and Linda Torczon convey both the art and the science of compiler construction and show best practice algorithms for the major passes of a compiler Their text re balances the curriculum for an introductory course in compiler construction to reflect the issues that arise in current practice Focuses on the back end of the compiler reflecting the focus of research and development over the last decade Uses the well developed theory from scanning and parsing to introduce concepts that play a critical role in optimization and code generation Introduces the student to optimization through data flow analysis SSA form and a selection of scalar optimizations Builds on this background to teach modern methods in code generation instruction selection instruction scheduling and register allocation Presents examples in several different programming languages in order to best illustrate the concept Provides end of chapter exercises

State-of-the-art Imaging in Stroke Bernhard Schaller, 2007 Stroke represents a clinical syndrome of rapid onset of focal or sometimes global cerebral deficit with a vascular cause lasting more than 24 hours or leading to death Eighty per cent of all strokes are ischaemic 15% are due to intracerebral haemorrhage and 5% to subarachnoid haemorrhage Correct diagnosis is important because treatment options for ischemic stroke may be contraindicated in case of intracerebral haemorrhage Such exact diagnosis requires state of the art imaging of the brain But which kind of imaging how quickly should it be done should this include imaging of cerebral blood flow and what is the most cost effective approach Answering these questions may help to further narrow the gap between experimental and clinical research as well may substantially improve the patient's care
