

TRANSMISSION

The transmission is an essential part of the engine in order to convert the power applied to the rear wheels, or to increase the speed with which they turn. In the transmission, are a number of gears of different sizes, and when we "shift gears," we put the larger and smaller gears in various combinations to produce the effect we want.

In low gear, we apply a great deal of power to the wheels, but not much speed. In second, we increase the speed with which the wheels turn, but we do not get quite so much power. In high gear, we get a great deal of speed, and the least amount of pulling power.

In addition to the three forward speeds, most positions of the gears reverse the action of the rear wheels and enable us to back up.

It is extremely important that the transmission be designed to permit easy and rapid shifting from one gear to another. In addition, it should be quiet in all speeds and of rugged construction.

Present-day the latest type of transmission, which automatically adjusts the speed of the gears being evolved so that they will slide together without clashing. (This permits even inexperienced drivers to shift gears smoothly and accurately.) All gears are balanced out—which is simple language means that all a driver or operator instead of straight across,—which reduces transmission noise to a minimum and adds to smoothness, because it permits more teeth to be in contact simultaneously and keep in contact longer than in the case with gears that are not straight across.

The only advantage you need give your Present transmission is to make sure it is lubricated in accordance with the directions given on the Lubrication Chart accompanying this book.

To those who are interested in a more detailed explanation of how the transmission works, we will be glad to send a booklet entitled "How the Wheels Revolve".

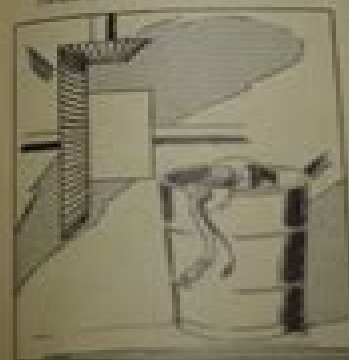

PROPELLER SHAFT

The propeller or drive shaft is a shaft that transmits the power of the engine from the transmission to the rear axle. The rear Propeller shaft is enclosed in a torque tube which absorbs the driving torque and twisting forces, relieving the rear of twisting forces. Only one end of the shaft is needed, mounted at the rear end and automatically lubricated from the transmission. The tubular propeller shaft is attached to the rear axle pinion by means of a flange-fitting and coupling.

REAR AXLE

The rear axle supports the weight of the rear portion of the car and provides the means of transmitting the power from the propeller shaft to the rear wheels.

Since the engine is placed at right angles to the axle shafts, it is necessary to change the direction of the power. The power enters the axle from one direction and comes out in another. The final gear in the middle of the axle takes the power around a corner, so to speak—round to the gears at the top of an old-time car cross member.

In addition to the gears that change the direction of the power there is another set of gears in the rear axle that serve a very important purpose—in a most important manner. They are called the differential gears.
