Performance Benchmarking of Application Monitoring Frameworks Jan Waller, 2015-01-14 Application level monitoring of continuously operating software systems provides insights into their dynamic behavior helping to maintain their performance and availability during runtime Such monitoring may cause a significant runtime overhead to the monitored system depending on the number and location of used instrumentation probes In order to improve a system s instrumentation and to reduce the caused monitoring overhead it is necessary to know the performance impact of each probe While many monitoring frameworks are claiming to have minimal impact on the performance these claims are often not backed up with a detailed performance evaluation determining the actual cost of monitoring Benchmarks can be used as an effective and affordable way for these evaluations However no benchmark specifically targeting the overhead of monitoring itself exists Furthermore no established benchmark engineering methodology exists that provides guidelines for the design execution and analysis of benchmarks This thesis introduces a benchmark approach to measure the performance overhead of application level monitoring frameworks The core contributions of this approach are 1 a definition of common causes of monitoring overhead 2 a general benchmark engineering methodology 3 the MooBench micro benchmark to measure and quantify causes of monitoring overhead and 4 detailed performance evaluations of three different application level monitoring frameworks Extensive experiments demonstrate the feasibility and practicality of the approach and validate the benchmark results The developed benchmark is available as open source software and the results of all experiments are available for download to facilitate further validation and replication of the results

Introduction to Noise-Resilient Computing Svetlana N. Yanushkevich, Seiya Kasai, Golam Tangim, A.H. Tran, 2022-06-01 Noise abatement is the key problem of small scaled circuit design New computational paradigms are needed as these circuits shrink they become very vulnerable to noise

and soft errors In this lecture we present a probabilistic computation framework for improving the resiliency of logic gates and circuits under random conditions induced by voltage or current fluctuation Among many probabilistic techniques for modeling such devices only a few models satisfy the requirements of efficient hardware implementation specifically Boltzman machines and Markov Random Field MRF models These models have similar built in noise immunity characteristics based on feedback mechanisms In probabilistic models the values 0 and 1 of logic functions are replaced by degrees of beliefs that these values occur An appropriate metric for degree of belief is probability We discuss various approaches for noise resilient logic gate design and propose a novel design taxonomy based on implementation of the MRF model by a new type of binary decision diagram BDD called a cyclic BDD In this approach logic gates and circuits are designed using 2 to 1 bi directional switches Such circuits are often modeled using Shannon expansions with the corresponding graph based implementation BDDs Simulation experiments are reported to show the noise immunity of the proposed structures Audiences who may benefit from this lecture include graduate students taking classes on advanced computing device design and academic and industrial researchers Table of Contents Introduction to probabilistic computation models Nanoscale circuits and fluctuation problems Estimators and Metrics MRF Models of Logic Gates Neuromorphic models Noise tolerance via error correcting Conclusion and future work
