world Mean while human genetics has seen dramatic developments and the molecular revolution has attracted thousands of scientists including many molecular biologists to this field About 3700 human genes have already been mapped to chromosomal sites Many such genes have been cloned and the various mutations causing disease have been identified Novel mutational mechanisms such as expanded trinucleotide repeats have been discovered in conditions such as Huntington's disease and the fragile X syndrome of mental retardation Gene action now can often be elucidated by studying the pathway from gene to phenotype following positional cloning rather than working in the opposite direction as was customarily done before the tools of new genetics were available In an increasing number of genetic diseases the pathogenic mechanisms have been elucidated with positive consequences for prevention and treatment It therefore became necessary to rewrite almost completely major portions of this book These developments are now making genetics arguably the leading basic science for medicine as well as a recognized medical speciality But all these changes do not mean that the entire framework of human genetics had to be reconstructed
